Claim; 19 age 2; 30pp; Japanese.

Claim; 19 age 2; 30pp; Japanese.

E.coli transformed with the DNA sequence 079569 are able to catalyse the epoxidation of alkenes. The DNA is derived from Nocardia corallina and comprises 4 open reading frames. ORPs amoA and amoC encode subunits 1 and 2 of the alkene monoxygenase enzyme and oRP amoD encodes a reductase capable of transferring electrons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     KATWTRDAAWQPLRRYVEDTLVVADPVELFIAQNLALDGLLYPLVYDRFVDERIALEG-G

Beta-1,3-glucanase is involved in plant defence against pathogens and as it hydrolyses polyssaccharides, useful in biomass conversion or paper making. The clones allow for transfer of the gene to other species and control of gene expression.
amoA, amoB, amoC and amoD derived from the 3 different reading frames of the operon. The gene is useful for the production of indigo via oxidation of indole. Nocardia corallina can be cultured in a medium contg. indole and will readily oxidise the indole yielding indigo into the culture medium. E. coli may also be transformed with the alkene mono-oxygenase gene and used as above to efficiently produce indigo by microbial oxidation.
                                                                                                                                                                                                                                                                                                                                                                                                    80 FYYASWATTRARQQDAMESNFEFVESRRMIGLMRDDVAARALDVLVPL------RHAA 131

Localised variation of colour density in the surface of a dyed

rellulosic rabric - uses cellulase compsn. able to hydrolyse

pritrophenyl -beta-1,4-cellobioside

Sisclosure; Pages 15-7; 23pp; English.

Che present sequence is the corrected version of the incorrect

Bacillus lautus (NCIMB 40250) endoglucenase Endo 3A described in

WO9110732. Endo 3 can be used in novel method of forming localised

colour density variation on the surface of a dyed cellulosic

fabric. The method comprises agitating the fabric in an aqueous

medium (PH 6.5 to 9.0) containing a family 5 cellulose,

e.g. the present sequence, which can hydrolyse p-nitrophenyl-beta

1.4-cellobioside, or a family 7 cellulase, and a mechanical

abrading agent or cellulose having abrading activity Each

cellulase displays 30 % or more of its maximum activity at pH 7.

"The process is useful to provide a stone washed look to blue jeans
                                                                                                                                                                                                                                                249

Example 32; page 46; 77pp; English.
This is the sequence of the plant pathogenesis-related protein (PRP), beta-1,3-glucanase. It confers systemic acquired resis-
                                                                                                                                                                                                                                                                                                                                                                                                                          tance to plants. The corresp. DNA is used, in a chimeric construct, to produce transpent plant cells or -tissues with the ability to regenerate into plants which are disease resistant. This is PR-glucanase of the tomato plant, and it has areas of complementarity to the ribbzyme coding region. The DNA sequence, (or homologue), encoding this protein, (or homologue), operably linked to a promoter or other regulatory sequence (providing suitable tissue and/or temporal specific expression), can be used to prepare a male sterile transgenic tomato plant. The male sterile tomato plants can be used to produce hybrid seeds. The DNA sequence of PR-glucanase can be used to restore male fertility to sterile plants containing gluconases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Beta-1,3-glucanase from cDNA clones pCL28, pCL30, pCL31, pCL43 and pCL36.

DNA encoding pathogenesis-related glucanase proteins - useful for producing transgenic plants with enhanced disease or pest resistance Disclosure; Column 247-248; 169pp; English.

The present invention describes a DNA molecule encoding a pathogenesis-related (PR) protein having beta-1,3-glucanase activity selected from PR-2, PR-2', PR-N', PR-N' pr-O and PR-O'. Also described are; (i) a chimeric gene comprising the above DNA molecule linked to a heterologous promoter; (ii) a vector containing the chimeric gene; (iii) a host cell containing the chimeric gene; (iv) a transgenic plant (iii) a host cell containing the chimeric gene; (iv) a transgenic plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    containing the chimeric gene; and (v) a seed from the transgenic plant. The DNA molecule is used to produce transgenic plants with enhanced disease or pest resistance. The present sequence represents a tobacco beta-1,3 glucanase protein for plasmid pGLN17 from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          118 ARALDVLVPLRHAAWGANMN-----NAQICALG------YGTVFTAPAMFHAM 159

Corremically controlling expression in transformed plants

Disclosure, Column 191-194, 175pp, Engglish.

Corremically controlling expression in transformed plants

Correct The gene can be isolated using the method of the invention.

Correction is for isolating a chemically regulatable DNA promoter

Correction regulated a chemically regulatable DNA promoter

a plant tissue. The method allows isolation of sequences which will be

Correcting regulatable sequence. This is useful in plants with a

con-coding regulator, the regulator being applied before or with the

correction or pesticide detoxification mechanism under the control of a

herbicide or pesticide detoxification mechanism under the control of a

confermical regulator, the regulator being applied before or with the

correction or pesticide to give optimal tolerance. The promoter fragment

beight, shape, development, male or female sterility, and the ability

correction of the promoter allows the regulation of production of

the plant to withstand cold, heat, salt and drought. The chanical

compounds, e.g. flavours, fragrances, pigments, natural sweeteners,

conflowerinal feedstocks, antimicrobials and pharmaceuticals, by

conflowerinal feedstocks, antimicrobials and pharmaceuticals, by

conflowerinal feedstocks, antimicrobials and pharmaceuticals, by

conditions of free expression either throughout the whole plant, or in

conflowering the leaves with the chemical regulator. Controlling the

conflowering the leaves with the chemical copialating chemical in

conflowering the leaves with the chemical regulator. Controlling the

control of the production of cultivated crops allows processes such

                                                                                                                                         Production of optically active amine(s) from ketone(s) and an amino donor using a transaminase derived from an Arthrobacter species. Claim 22: Page 56-57: 84pp; Japanese.
The present sequence represents a protein with stereoselective transaminase activity. The transaminase is used to produce the optically active amines (having R-chirality) of the invention. A ketone is treated with a transaminase in the presence of a primary amine as amino donor to produce the amines. The chiral amines are synthetic intermediates for use as pharmaceuticals and agrochemicals.

Submitted (SEP-1997) to the EMBL/GenBank/DDDJ databases.

-! FUNCTION: FURNISHES A MEANS FOR FORMATION OF CORRECTLY CHARGED
GLN-TRNA(GLN) THROUGH THE TRANSAMIDATION OF MISACYLATED GLU-
TRNA(GLN) IN ORGANISMS WHICH LACK GLUTAMINIT.TRNA SYNTHETASE. THE
REACTION TAKES PLACE IN THE PRESENCE OF GLUTAMINE AND ATP THROUGH
AN ACTIVATED GAMMA-PHOSPHO-GLU-TRNA(GLN) (BY SIMILARITY).

-! CATALYTIC ACTIVITY: ATP + L-GLUTAMYL-TRNA(GLN) + L-GLUTAMINE = ADP
+ PHOSPHATE + L-GLUTAMINNI-TRNA(GLN) + L-GLUTAMINE = ADP
-! SUBUNIT: HETEROTRIMES FOR A, B AND C SUBUNITS (BY SIMILARITY).

The present sequence encodes Alcaligenes sp. protein PoxC. The present invention also describes PoxB, PoxI, PoxE, PoxF, PoxG, PoxI and PoxI. The proteins are useful in the fields of petroleum purification, chemical industry and drug industry related to the synthesis, conversion and decomposition of aromatic compounds.

Claim 1; Page 15-23; 43pp; English.
The gene (047743) encodes a spike protein (R40815) which is lacking the transmembrane and cytoplasmic anchor regions of native IBV.
The truncated spike protein can be used to vaccinate fowl, esp poultry,

Proteins encoded by IBV strains M41, D1466, D207 or D274are claimed together with the genes that encode them, and the gene that encodes a protein from IBV strain H120. In addition, a peptide is claimed, characterised in that it comprises at least one of the regions in which the AA sequences of the IBV strains M41 and M42 are different, esp. the region between AAS 5 and 70 and/or between AAS 190 and 301.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New gene coding for protein of infectious bronchitis viruses -useful in prodn. of peptide or protein for vaccination of poultry against the viruses.

threonine synthase, threonine deaminase or S-adenosylmethionine synthase. The invention also relates to the construction of a chimaric gene encoding all or a portion of the biosynthetic pathway enzyme, in sense or antisense orientation, where expression of the chimeric gene results in production of altered levels of the enzyme in a transformed host cell. Overexpression or reduction of enzyme expression of genes encoding the amino acid biosynthetic pathway enzymes in crop plants such as corn, soybean and wheat can be used to alter levels of the amino acids in human food and animal feed. Transformed host cells can also be used to identify compounds that sequence 394 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2 SNVFIAFQANED-----SRPIVD---AIVADNPRAVVVESPGMVKIDAPDRLTIRRET 51

This is the amino acid sequence of a full-length wheat
S-adenosylmethionine synthetase, as deduced from a cDNA contig (see
8.767185) obtained from kernel, leaf, seedling and root cDNA clones.
The wheat enzyme shows sequence similarity to the barley enzyme.

The invention relates to new isolated nucleic acid fragments (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New plant amino acid biosynthetic enzymes, DNA and chimeric genes encode: dihydropicolinate reductase; diaminopimelate epimerase; threonine synthase; threonine deaminase; S-adenosylmethionine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              X07168-85) encoding plant enzymes (see W97727-44) that catalyse steps in the biosynthesis of lysine, threonine, methionine, cysteine and isoleucine from aspartate, the enzyme being selected from dihydropicolinate reductase, diaminopimelate epimerase,
                                            Wheat S-adenosylmethionine synthetase.
S-Adenosylmethionine synthetase; wheat; amino acid; lysine;
threonine; methionine; cysteine; isoleucine; transgenic plant;
crop improvement; food; feedstuff.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | :| || :| || :| 335 ILKLVKENFDFRPGMISINLDLKKGGNRFIKTAAYGHFGRDDADFT 380
